THE INTRALASE METHOD™:
JUST THE FACTS

Before making the decision between a blade-free or microkeratome LASIK procedure, make sure you’re armed with the facts. This information will help you make an informed decision about what’s best for you.

More patients get to 20/20 vision and beyond with the IntraLase Method.¹

IntraLase cannot be individualized. IntraLase allows surgeons to tailor the corneal flap for each individual patient, and each individual eye. FALSE

IntraLase improves precision, and visual results of LASIK, whether you choose to have a standard or custom procedure.² TRUE

IntraLase is not accurate. IntraLase delivers micron-level accuracy, giving your doctor more control during the procedure and the ability to create a flap of precise size, shape, and depth—factors that are critical to a successful LASIK outcome.³ FALSE

Leading doctors and teaching hospitals from around the world believe in IntraLase and use the IntraLase Method. TRUE

Patients prefer procedures using a microkeratome blade. More patients (61%), when given a choice, chose the IntraLase Method over a microkeratome blade.⁴ FALSE

More than 600,000 IntraLase procedures have been safely performed. TRUE

The IntraLase Method takes much longer to perform than a microkeratome procedure. The IntraLase Method takes approximately 15-30 seconds per eye and a total of 10 minutes for the entire LASIK procedure, which is comparable to—and sometimes faster than—procedures using a microkeratome.⁵ FALSE

IntraLase is the most sophisticated and accurate technology for corneal flap creation available today and has given many patients greater confidence and assurance in choosing laser vision correction. TRUE
